

Reference project - Installation of a wellness area

Project outline

Our task was to sensibly control the lighting planned by the interior designers. In addition, the sauna and the heating should be able to be controlled smartly.

The implementation was carried out using KNX and visualization. So that the entire area can be conveniently monitored and controlled on site using touch sensors, as well as remotely using a mobile app.

The installation was carried out in close cooperation with the other trades involved in the interior design and resulted in a harmonious overall picture.

Project data

- Built in 2021
- Wellness area with sauna, relaxation room, sports area, changing room,
- shower, toilet and terrace

Services rendered

- Planning
- KNX bus system for lighting, sauna and heating control
- Gira GIRA X1 visualization server
- Data network
- Delivery and installation of the lighting
